

What's New? Space Planning and Management

3D Navigator in the Space Console

To achieve 3D visualisations of buildings and floors, together with the powerful analytics, highlights, and filters of the Space Console, the Space Console integrates the Web Central 3D Navigator. Space planners and managers may switch seamlessly from 2D to 3D visualisations for buildings and floors that are published in 3D from Revit. Use the 3D view to visualise how systems and spaces connect throughout the building. Use 2D plans for data-intensive tasks, such as reviewing room attributes, managing occupancy and move locations, or identifying team space zones.

Filter by Site or Map in the Space Console

Space managers, department managers, or users of the Space Console often do not know building names as readily as they know their locations. To aid users in finding the buildings and floors they're interested in studying, the Space Console offers the ability to filter on buildings by starting with a map or site plan.
